HP Double Eccentric Butterfly Valve

ZHEJIANG BOTELI TECHNOLOGY CO.,LTD.

Technical characteristics

DR series high performance butterfly valve is our own develop and design product.

It has double eccentric disc structure, adopting memory sealing ring wrapped strengthen ring composite structure seat, using flexible sealing technology, eliminating abrasion, plastic deformation, influence of temperature and pressure changes so achieve a reliable seal. This type of valve has the advantages of compact structure, light weight, reliable sealing. Compared with traditional valve, it has convenient installation, convenient maintenance and longer service life. Applicable to the petroleum, nature gas, chemical industry, metallurgy, water heating, electricity industry. Widely used for continuous adjustment or switch operation in automatic control system of production process.

Technical characteristics

Unique seat structure

- Bi-direction elastic seal and zero leakage
- Automatic compensation to the change of temperature and pressure
- Effective sealing pair with large adjustment range
- Long service life, little maintain

Double-eccentric disc design

- Seat and disc are out of touch in whole open process
- No abrasion on up and down position of seat
- Low operate torque

Convenience for seat maintenance

- Take down gland to change seat, no need to disassemble disc and stem.

Meet both cut off and control

- Excellent control characteristic
- Flow curve equal ratio to change
- Wide adjustable range
- Used for control but still with effective sealing

Fireproof structure

- Fireproof valve conform to API607 and BS6755 part 2.

Technical specification

- Structure: Wafer type, Lug type, Double-flange Type
- Class and Size:
 - ANSI CL150 NPS2-NPS60
 - ANSI CL300 NPS3-NPS60
 - ANSI CL600 NPS4-NPS24
- Body material: WCB、CF8M
- Seal Ring: PTFE/Silicone Rubber Strengthen Ring
- RPTFE/Silicone Rubber Strengthen Ring
- Face to face: Comply to API609
- Drive operation

2" -8" butterfly valve can be open and close operated with the handwheel, also can be set to partially open.

The locking device on the handwheel locks the disc at any position on 10% space of opening and closing route.

Manual worm gearing can open valve to any intermediate position, also can be operated easily under high pressure difference.

Use secure double acting pneumatic device and electric device, automatic control for valve operation.

In need of proportional control for flow, there's corresponding actuator and positioner can be chose.

Structure feature

■ Gland flange

Exert pressure to Packing gland, preventing external leakage, and completely adjustable.

■ Bearing

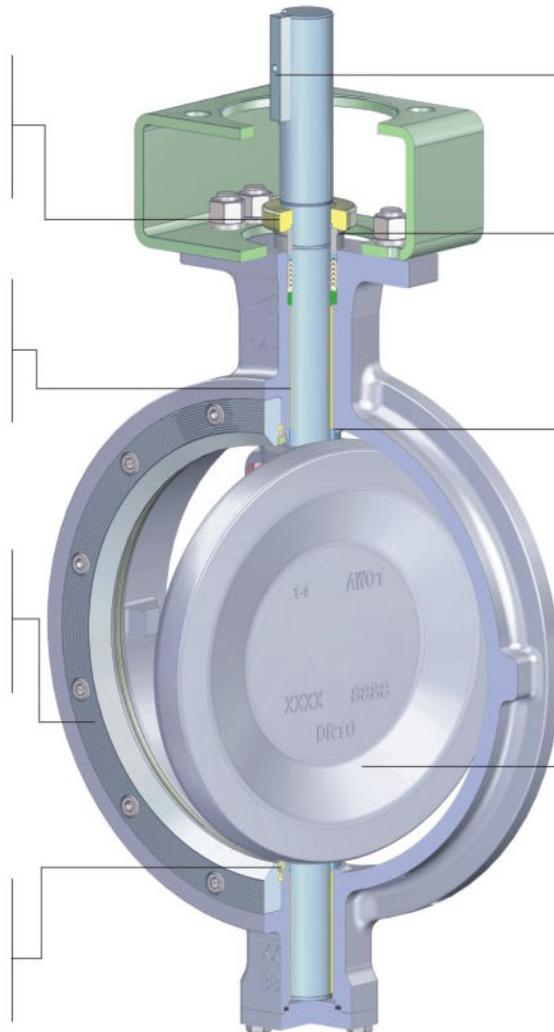

PTFE clad stainless steel bearing centring connect with stem. It is high load, small erosion, low friction factor etc.

■ Seat gland

Take down gland to change seat, no need to disassemble disc and stem.

■ Seat

Bi-direction sealing seat, elastic strengthen ring inside of seat to provide sealing elasticity.

■ Key

Adopt square key for valve and drive device, it can make malfunction occur in external control point when the torque is too large.

■ Packing gland

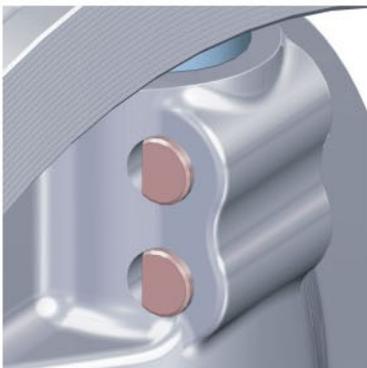

Packing gland and gland flange act independently to prevent packing uneven load.

■ Thrust washer

Keep the center position of disc

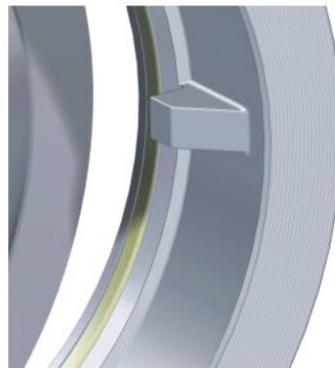

■ Disc

Adopt 360° uninterrupted spherical structure for disc sealing face. Provide maximal flow, minimum fluid resistance and high kv value.

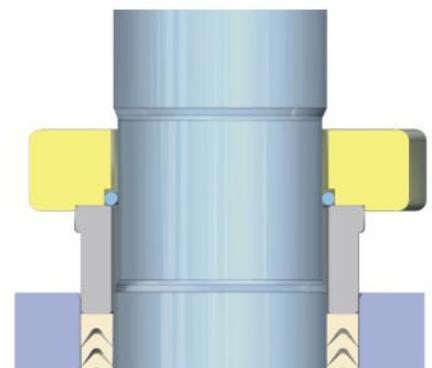

Connection of stem and disc

Unique design for connect pin between stem and disc, tight and reliable pin connection, nice interchangeability.

Route Stopper

Internal limit position design prevents the disc over travel, so as to prolong the service life of seat and reduce the possibility of seat damage.

Blow-out proof stem

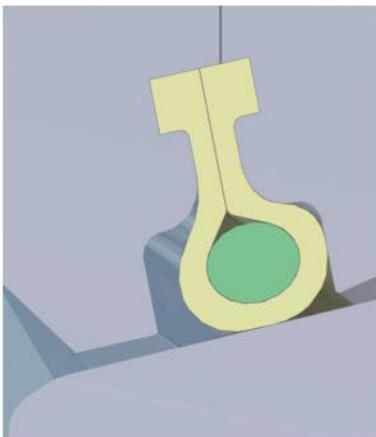

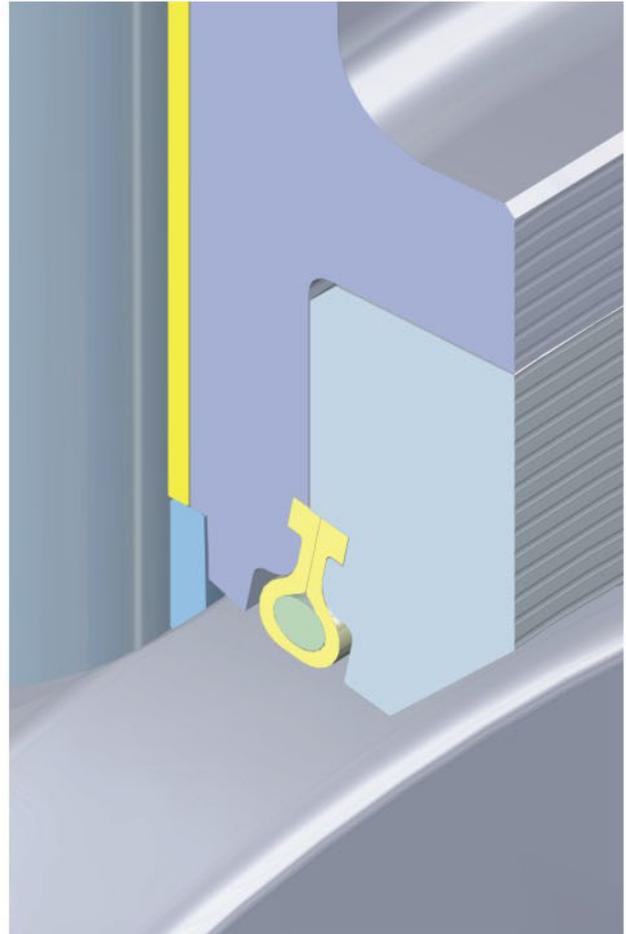

Install a locating ring between groove of stem and packing gland, when stem fractured internally, it can prevent stem blowing out to hurt people.

Structure feature

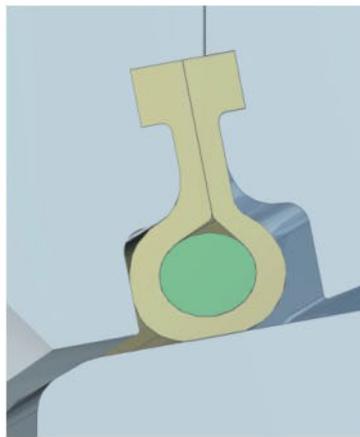

Unique structure of two pieces seats, composed of seat wrap with elastic strengthen ring. This simple and reliable design has many unique advantages:

- Elastic strengthen ring wrapped with seat, insulated medium of pipeline completely.
- The groove in body and seat gland and tooth profile design effectively assured the seat fixed well on the needed position at any time.
- The seat gland connects body by bolt, locked the seat in correct position. Even if there is no counter flange, valve seat also can be reliably fixed.
- Reliable fixed and nice supporting seat rely on the disc and the medium pressure to enhance the sealing ability. When the pipeline pressure increased, the sealing performance is enhanced. When in low pressure or vacuum state, the valve seat also can provide excellent sealing performance through its own memory.
- Zero leakage bi-direction sealing function
- Memory characteristics of seat can adjust itself according to abrasion and temperature change, always maintain a stable sealing
- Quick and easy seat replacement process can be completely finished just by removing the retainer ring, turning the disc to the closed position, replacing the new seat into groove of body. It's simple, fast and does not affect the disc, stem and other parts.

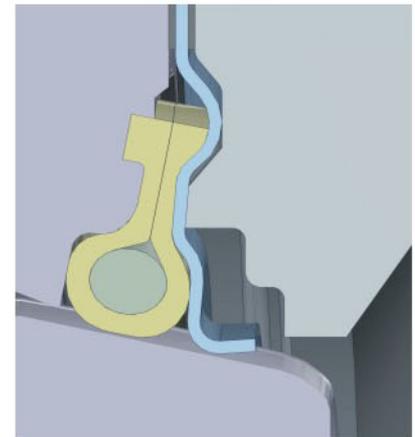

Close the valve, medium flow from left to right.

The seat moves toward the direction of media flow, pressing on the disc, preventing the leakage strictly. The higher of pipeline pressure, the tighter of sealing between seat and disc.

Close the valve, medium flow from right to left

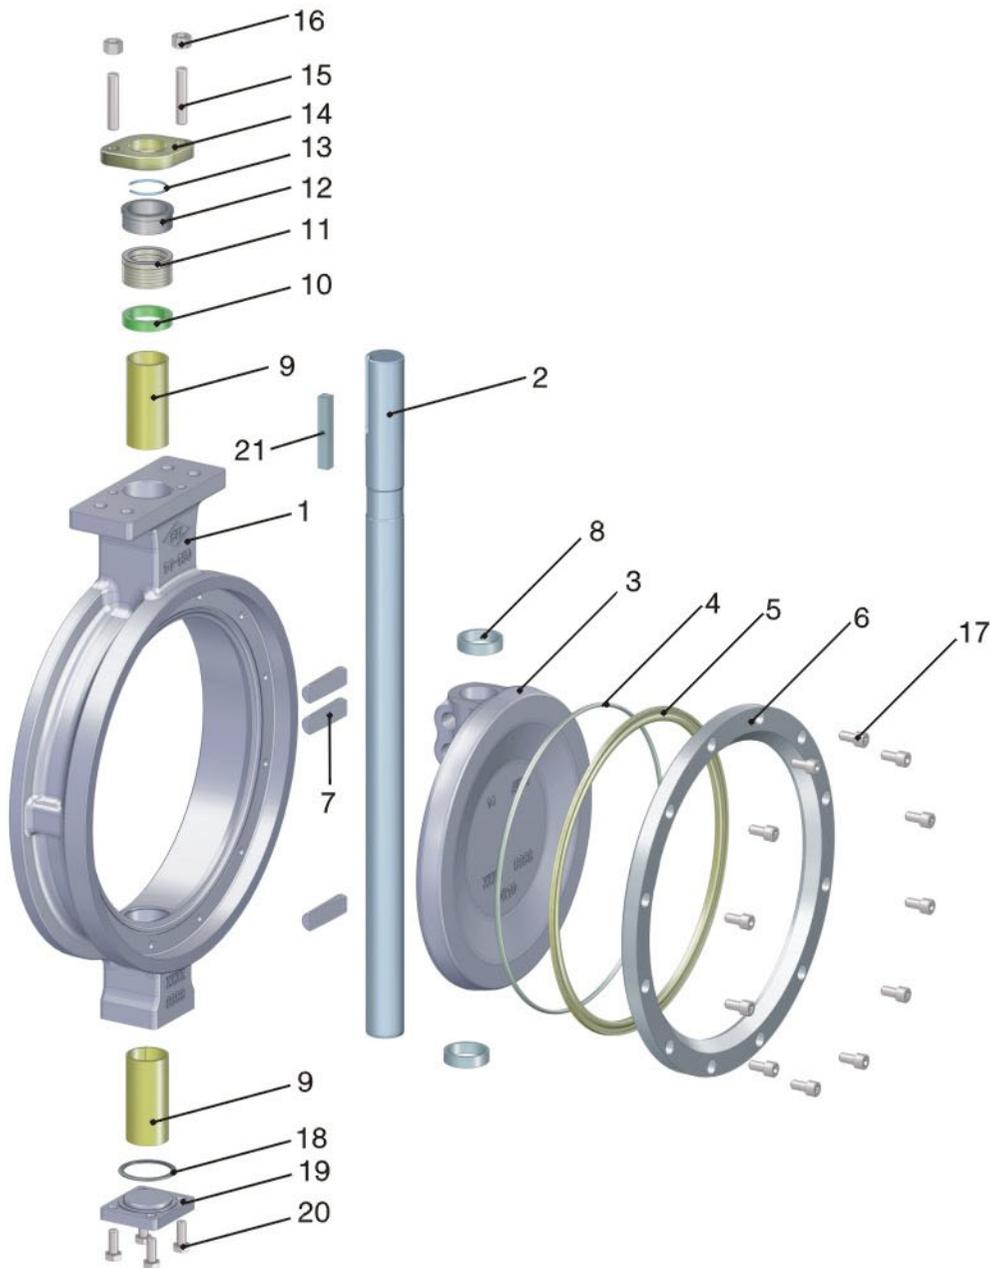

The seat moves along the direction of media flow, close to disc to ensure reliable bi-direction sealing. It has reliable sealing performance from vacuum to high pressure

Fire-safe seat structure

Generally, the elastic seat and metal seat both touch disc at the same time. When the fire occurs, metal seat always keep touch steadily with disc when elastic seat damaged partly or completely. No matter which direction of media flow, it can always provide reliable Seal.

Breakdown Structure

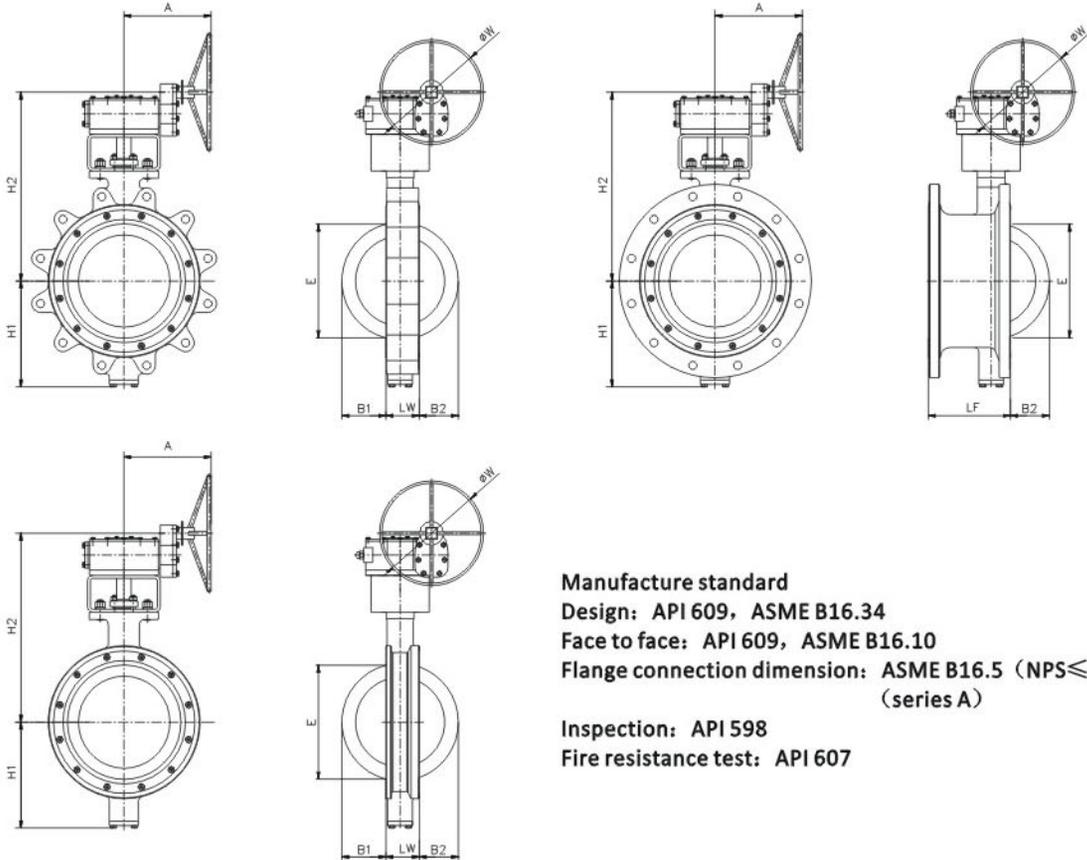

Item	Part name	Material		Item	Part name	Material	
1	Body	A216 WCB	A351 CF8M	12	Packing gland	A276 304	A276 316

Rated value of seat

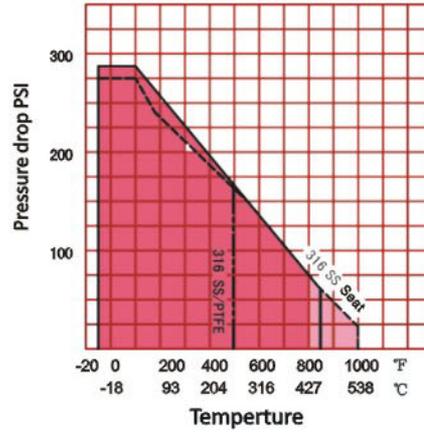

Rated value of seat only refer to seat, it means differential pressure on both sides of disc when the valve is fully closed.
 Rated value of body according to ANSI B16.34

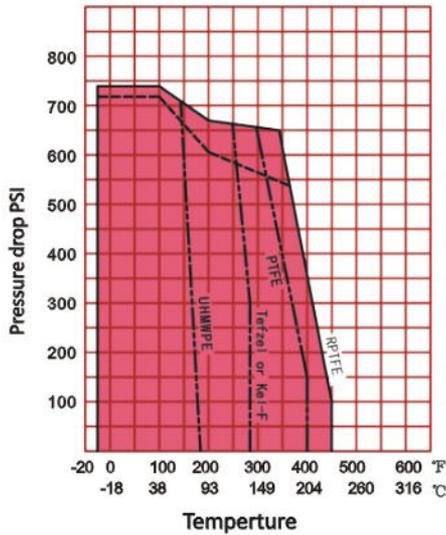

CL150 Soft seat valve

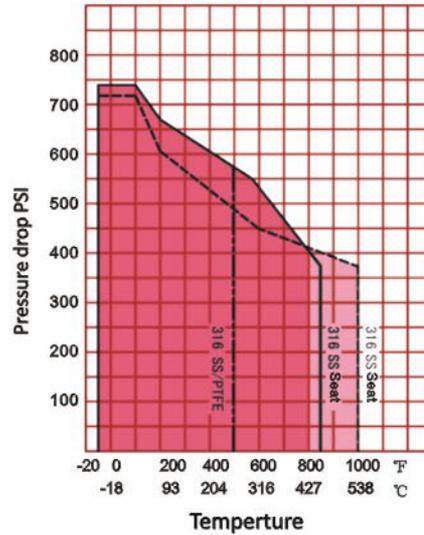

CL150 Fire safe and high temperature valve

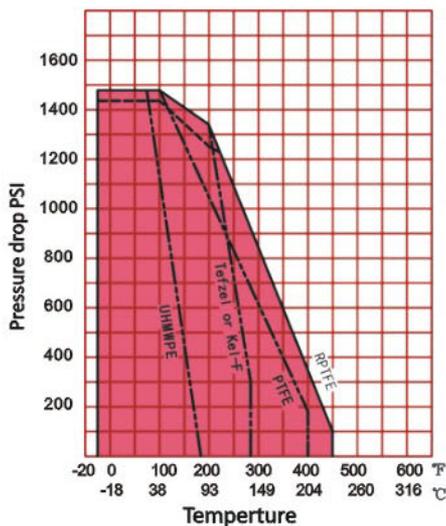

CL300 Soft seat valve

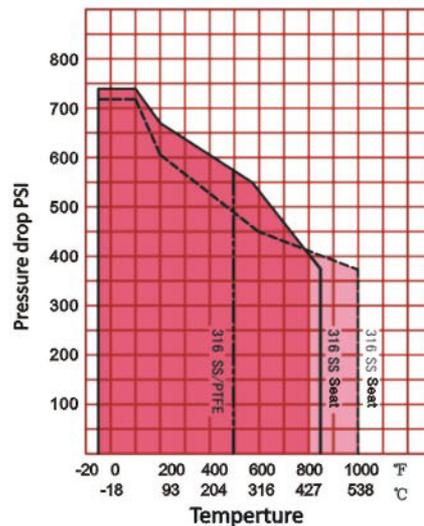

CL300 Fire safe and high temperature valve

CL600 Soft seat valve

CL600 Fire safe and high temperature valve

Carbon steel body, Stainless steel body, type of seat

17-4PH stem Inconel Stem

Application

DR series butterfly valve applied to variety of working conditions, such as corrosive chemicals, water, gas, acid, alkali, hydrocarbons and many other fluids. It has a variety of materials selection and configuration to meet the requirements in different conditions.

Vacuum condition

Standard series valve is recommended to used in vacuum condition under absolute pressure 0.02mm or 20 μ m Hg absolute pressure. As for the vacuum conditions as low as 1×10^{-3} mm or 1 μ m Hg absolute pressure, it is recommended to use special valve. After special treatment, it can be used up to 1×10^{-6} mm Hg pressure.

Steam condition

Specially designed standard series valve can be used for high temperature and high pressure conditions. It acts a switch or regulatory role for hot water, condensation water, cooling water pipes. It can reach 10.3bar(150psi) pressure standard for 185°C (366 °F) saturated steam. It is recommended to use the standard RPTFE seat in this application.

Oxygen condition

Standard series valves for the high requirements of the gaseous oxygen condition must be special prepared (cleaning, inspection, installation and test) to ensure the removal of burrs, sharp edges, dirt, grease, carbonization hydrogen or other pollutants. Each valve need to wipe cleanly, coated with polyethylene seal before shipment. Another important feature of the valves used in oxygen conditions is electrostatic which may occurred in the safety conduction. There's a grounding gasket in stem.

Ash and friction condition

Similar conditions such as cement, silt, ash and ash cleaning, carbon (dry or slurry state), slag, industrial waste or residue, glass and silicon, lime slurry, alkali, coal or cocoa flavor, powder metallurgy ore or ore sand, and so on. Under such conditions valve service life depending on flow, pressure difference, temperature difference, solid content, size and hardness of solid, and frequency of use.

Pipeline end condition

Optional pipeline end sealing appl, suitable for full rated pressure pipeline end.ications

Low temperature conditions

There are full cryogenic valves and semi cryogenic valves. Stainless steel body, stainless steel and PCTFE combination seat. The seat is axial direction deformation sealing, ensure the cut off.

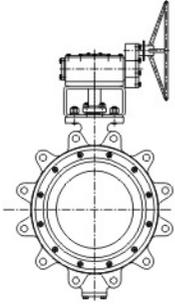

Air conditioning system

It can replace block valve, isolating valve, throttle valve used in humid environment or "balance" flow, also can be used to control water pump inlet and outlet, or for pipeline connection, acting like cut off valve, bypass valve and so on. The temperature is usually not higher than 260°C

Corrosion condition

"Corrosive" usually refers to sodium, potassium, and calcium hydroxide. Amine solution and alkali carbonate can also be placed in the same sort.

In most conditions, corrosive won't corrode heavily to ordinary carbon steel, also will not corrode PTFE or RPTFE seat. So, full carbon steel valves with PTFE seat would be fine. However, there are varieties of operating conditions in corrosive environment, material selection for valve must be sufficient to resist corrosion or meet the purification requirement.
